

ChainTris

Battle-royale Tetris where entry fees form a SOL prize pool for the last block standing

The Problem & Our Solution

Tetris battle royale games are fun but pointless without real stakes or provable fairness.

- Existing Tetris 99-style games have no real stakes, so competitive players lose interest fast
- No way to verify match RNG is fair, leaving room for distrust in outcomes
- ChainTris pools SOL entry fees into an escrow contract as a real prize pool
- Commit-reveal RNG seed makes every piece sequence verifiable and cheat-resistant
- Winners are paid automatically on-chain based on verified final standings

How It Works

Players connect a wallet, pay entry fee, battle in real time, and get paid automatically when the match ends.

- User flow: connect wallet, pay SOL entry fee, join match lobby, play, get ranked, receive payout
- Real-time multiplayer Tetris (up to 8 players MVP) built with Colyseus, React, and Phaser.js
- On-chain: Anchor program escrows entry fees, locks commit-reveal RNG seed, and distributes prizes
- Match server reveals RNG seed after commit phase so piece sequences are provably fair
- Spectator mode lets others watch ongoing matches without joining the escrow

Built with

Solana, Anchor, Rust, Colyseus, React, Phaser.js, Solana Wallet Adapter

Why Now & What's Next

Solana's speed and low fees finally make real-money casual multiplayer gaming practical.

Category

Gaming

- Solana's low fees and fast finality make microtransaction-based game economics viable in real time
- On-chain gaming has strong hackathon and grant momentum right now
- Next: scale matchmaking to 50-99 concurrent players for the full battle royale experience
- Next: add spectator betting on ongoing matches
- Next: introduce seasonal ranked ladders with NFT trophies
